TEAT DIP

Is Your Teat Dip Doing Its Job?

Summer mastitis and an elevated SCC can hit your herds production and have a detrimental effect for the rest of your lactation. It is vital that at and just after peak milk yield that your cows are properly protected. Warm dry conditions along with increased fly count create ideal conditions for Mastitis infections. Not only should your teat dip be protecting your cows from infection, but it should be preventing chapping and unnecessary teat damage.

Choose the Right Teat Dip:

- ✓ Use a ready-to-use (RTU) formula — no mixing with water
- ✓ Look for chlorhexidine + lactic acid — effective & gentle
- ✓ High emollients for healthy, soft teats
- ✓ Bonus: Fly repellents help during summer

Why Chlorhexidine + Lactic Acid?

Kills mastitis-causing bacteria fast (Staph. aureus, Strep. uberis, E. coli)

Lactic acid exfoliates & promotes healthy skin

Emollients boost teat condition & comfort

Result: Healthier teats, less mastitis, better milk quality

ARE YOU USING 5+ BARRELS OVER 2 YEARS ? MAKE THE SWITCH TO AN IBC AND SAVE UP TO €500

DETERGENTS

Effective use of Dairy Detergents and Descalers

With modern milk testing standards, it is vitally important that you have the best hygiene in your milking plant possible. You need to ensure you are using the correct solution volume, concentration, temperature and circulation time to have an effective wash routine.

Aim for hot water to be circulating at 75–80°C and let this run for up to 7 minutes for effective cleaning. Recommendation of 10 litres per unit as rough guide to ensure you are using enough water.

A strong caustic such as Buyrite Coldwash powder (77% caustic powder) or Buyrite Chlorine free (29% Caustic) will remove fat and protein deposits from the milk line. Always aim for a caustic detergent with at least 24% caustic.

For mineral deposits such as limescale, Buyrite Descale 52% should be used in every 1 in 5 washes in areas with hard water.
